QUALITY THOUGHT

PLAYWRIGHT - TEST-2

Name: _____ Batch No: _____

---

1. You have experience in Selenium WebDriver. Your new project is planning to migrate from Selenium to Playwright. What differences have you observed between these two tools?
2. You have been working on manual testing, and now your project wants to implement automation testing. How would you identify which test cases should be automated first?
3. Your application contains 500 test cases. The execution time is very high. What Playwright features would you use to improve the execution speed?
4. Imagine you are automating an e-commerce application. Which scenarios would you automate first: Login, Search Product, Add to Cart, Payment, or Logout? Explain your approach.
5. You have joined a new automation project, and your manager asks you to set up Playwright from scratch. What steps would you follow to create the project?
6. You installed Playwright using npm init playwright@latest. However, when you execute the test, the browser is not launching. How would you troubleshoot this issue?
7. Your project contains package.json, package-lock.json, and node_modules. Can you explain the purpose of each file or folder and what happens if you delete node_modules?
8. Your manager asks you to automate the SauceDemo login page. How would you write your first Playwright test to open the application and verify that the login page is displayed?
9. You have written the following code:

```
test('Verify Login Page', async ({ page }) => {
await page.goto('https://www.saucedemo.com/');
});
```

   Can you explain what test(), page, and async are doing here?
10. Suppose you have five test cases in a single spec file. The third test case fails. Will the fourth and fifth test cases execute? Explain how Playwright handles this situation.
11. You are executing tests in headless mode, but your manager wants to see the browser actions while the test is running. Which command would you use?

12. You are debugging a locator issue. You want to stop test execution at a particular line and inspect the page. How would you use page.pause()?

13. You have opened the SauceDemo application. Your manager asks you to verify whether the correct application has been launched. How would you validate the page title and URL?

14. Your team executes tests locally in headed mode, but Jenkins executes them in headless mode. Is this a valid approach? Explain why.

15. You joined a project where every test case contains a complete application URL. Your manager wants to maintain the application URL in one common place. How would you implement this using baseURL?
